Assignment 3

Problem Statement: Abalone Age Prediction

Description:

Predicting the age of abalone from physical measurements. The age of abalone is determined by cutting the shell through the cone, staining it, and counting the number of rings through a microscope -- a boring and time-consuming task. Other measurements, which are easier to obtain, are used to predict age. Further information, such as weather patterns and location (hence food availability) may be required to solve the problem.

Importing Modules

import numpy as np

```
import pandas as pd
import seaborn as sns
import matplotlib.pyplot as plt
```

1 Dataset has been downloaded

```
In [ ]:
#Name of the dataset: abalone.csv
```

2 Load the dataset into the tool

```
In [12]:
data=pd.read_csv("abalone.csv")
data.head()
Out[12]:
```

```
Sex Length Diameter Height Whole weight Shucked weight Viscera weight Shell weight Rings

                                                                            0.0395
                                                                                           0.055
         0.330
                                                                                                       7
     Т
```

Let's know the shape of the data

(4177, 9)

```
In [13]:
data.shape
Out[13]:
```

One additional task is that, we have to add the "Age" column using "Rings" data. We just have to add '1.5' to the ring data

```
In [14]:
```

```
Age=1.5+data.Rings data["Age"]=Age
data=data.rename(columns = {'Whole weight':'Whole_weight','Shucked weight': 'Shucked_weig
ht','Viscera weight': 'Viscera_weight',
'Shell weight': 'Shell_weight'}) data=data.drop(columns=["Rings"],axis=1)
data.head()
```

Out[14]:

	Sex	Length	Diameter	Height	Whole_weight	Shucked_weight	Viscera_weight	Shell_weight	Age

3 Perform Below Visualizations.

i Univariate

Analysis#

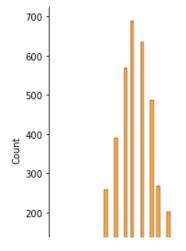

The term univariate analysis refers to the analysis of one variable. You can remember this because the prefix "uni" means "one." There are three common ways to perform univariate analysis on one variable: 1. Summary statistics - Measures the center and spread of values.

#

Histogram

```
In [16]:

ii Bi-Variate Analysis#

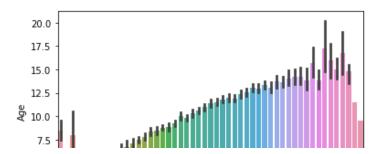

Image result for bivariate analysis in python It is a methodical statistical technique applied to a pair of variables (features/ attributes) of data to determine the empirical relationship between them. In order words, it is meant to determine any concurrent relations (usually over and above a simple correlation analysis).

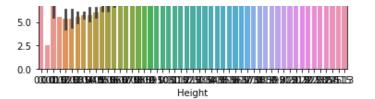

#

Barplot

Regplot

In [48]:
Out[48]:

<AxesSubplot:xlabel='Age', ylabel='Height'>

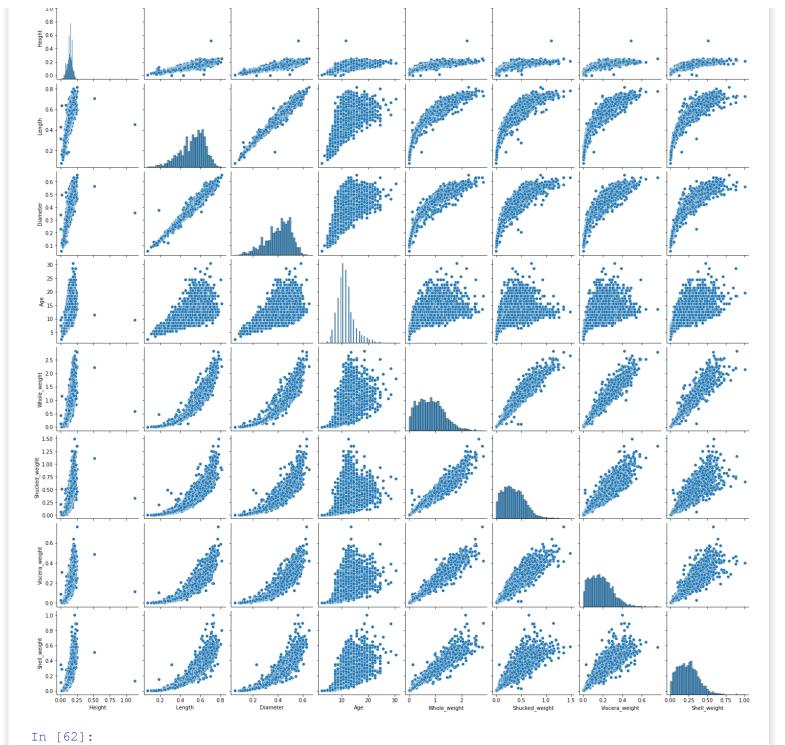

iii Multi-Variate Analysis#

Multivariate analysis is based in observation and analysis of more than one statistical outcome variable at a time. In design and analysis, the technique is used to perform trade studies across multiple dimensions while taking into account the effects of all variables on the responses of interest.

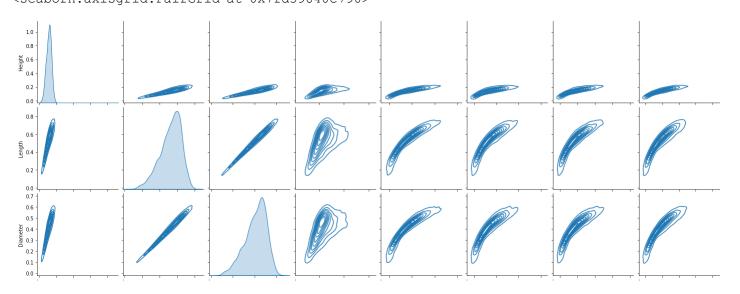

#
